

Think

- **What's your favourite food?**
- Think about eating it now.
- **Why are you like a dog? (or cat/rat/pigeon)**

Learning Theory and Attachment

The Learning Approach

- An approach in Psychology is what a specific set of theories / ideas / researchers focus on and believe about where behaviour comes from – e.g., cognitive, biological, learning
- The learning approach has 3 main theories

- **Classical Conditioning**

- Operant Conditioning

- **Social Learning Theory**

Behaviour is acquired through association, rewards and punishments

Behaviour is acquired through observing and copying others

(Simple) Classical Conditioning

- Association – linking a neutral stimulus (something that doesn't naturally generate a response) to an...
- **Unconditioned stimulus (e.g., chocolate, which makes your mouth water naturally!)**

Pavlov's Dogs

Classical Conditioning: The Basics

In this video we'll introduce very basic concepts in classical conditioning by simulating Pavlov's experiments with dogs.

(Simple) Classical conditioning

- **Before conditioning**

- NS (technician) → no response
- UCS (food) → UCR (salivation)

- **During conditioning**

- Technician (NS) + Food (UCS) → Salivation (UCR)

- **After conditioning**

- Technician (CS) → Salivation (CR)

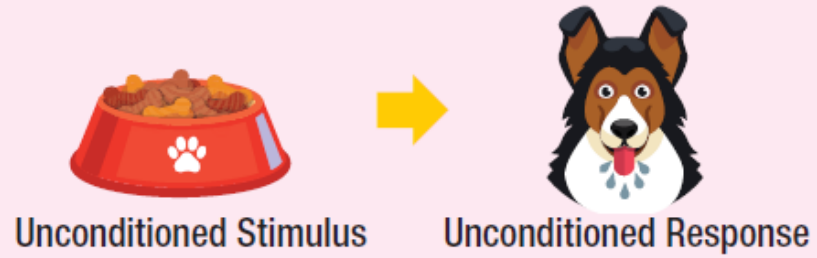

How do you get a fear of lifts?

- Neutral Stimulus
 - **Unconditioned Stimulus (UCS) is ...**
 - Unconditioned Response (UCR) is ...
 - **UCS + ... → ...**
 - CS (...) → CR (...)
- Neutral Stimulus = Lift
 - **UCS = being trapped**
 - **UCR = fear/scared**
 - **UCS + NS → UCR (conditioning)**
 - CS (Lift) → CR (fear)

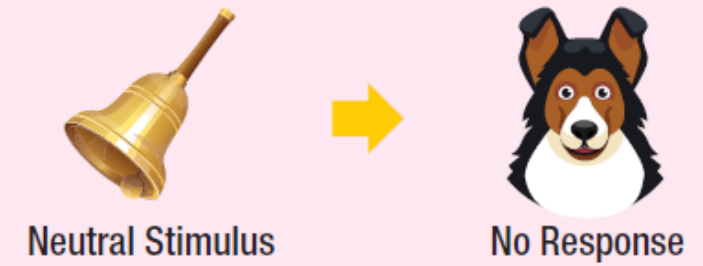

Fear as a conditioned response

- Explain how you would get a fear from these objects:
 - A bicycle
 - **A dog**
 - An airplane
 - **A snake**
 - An A Level subject

1. Before conditioning

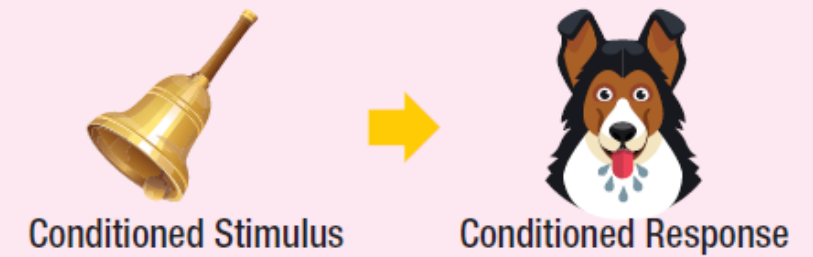

2. Before conditioning

3. During conditioning

4. After conditioning

Classical Conditioning & Attachment

Pavlov's dog is now
a baby

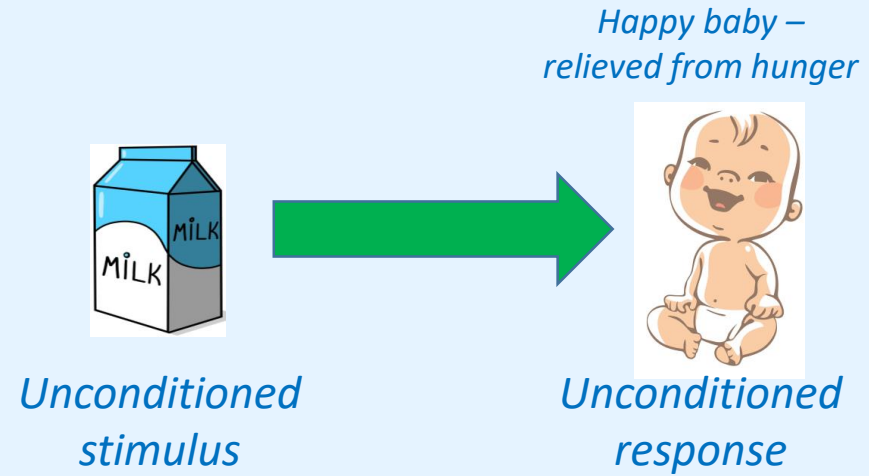

The bell is now the
mother

The dog food is
now milk

1. Before conditioning

2. Before conditioning

3. During conditioning

4. After conditioning

Classical Conditioning & Attachment

Task: Write a short summary of how children form an attachment through classical conditioning. Use your diagram to help you.

Hint: Make sure that you relate your answer to the formation of an emotional tie/bond between the mother and child.

Don't just outline classical conditioning.

Operant conditioning

What is Operant Conditioning?

- OC is about learning through consequence (result).
- **It was developed by B.F. Skinner in the 1930s and 1940s**
- Skinner created the 'Skinner box' to test the behavioural responses and learning of small animals such as rats.
- **A behaviour is only repeated if it has a +ve consequence**
- If the behaviour has a -ve consequence – it stops

The Skinner Box

Pigeons and Ping Pong

We don't really believe he did this...

How Operant Conditioning Works

- **If a behaviour results in a**
 - Pleasant outcome → reinforced (and likely to be repeated)
 - **Unpleasant outcome → punished (less likely to be repeated)**
- For Skinner's rat:
 - **Press button → get food → reinforcement → press button again**
 - Press button → get a shock → punishment → don't press button again

OC and attachment

- **Crying → attention and food → +ve reinforcement**
- Baby crying → feed it, crying stops → -ve reinforcement

- **Positive reinforcement – get something you want**
- **Negative reinforcement – stop something you don't want!**

THIS IS
AUDREY.

Types of drive

You need this to survive

- Food
- Water
- Sex
- Shelter
- Sleep

Nice to have and helps you get a 'need'

- Money
- Bed
- A Levels

Primary & Secondary Drives

- Primary drives = basic survival needs (food, sex, water)
- **Secondary drives = fulfill a primary need e.g., we want money because we can therefore buy food – so money = secondary reinforcer**

Attachment → a secondary drive

- **Hunger → primary drive**
- The caregiver feeding the baby is *associated* with the primary drive reduction
- **The caregiver's behaviour → attachment → secondary drive**
